# STAT 3743 • PROBABILITY \& STATISTICS • FALL 2010 • KERNS 

Quiz \#4
Name: ANSWER KEY

Note: the questions are randomly generated so these may (not) exactly match those on your paper. The answers below are for these and if you have trouble seeing the connection between these and those, ask me.

1. Suppose $X$ is a discrete random variable with PMF

| $x$ | 0 | 1 | 2 | 3 |
| :---: | :---: | :---: | :---: | :---: |
| $f_{X}(x)$ | 0.31 | 0.32 | 0.1 | 0.27 |

Find the mean, $\mu$.

## Solution:

Just multiply the top row by the bottom row and add up the products. The answer is
[1] 1.33
2. Let $X \sim \operatorname{binom}($ size $=65$, prob $=0.52)$. Find $\mathbb{P}(X \leq 30)$.

## Solution:

The above would be the sum of the probabilities (given by the PMF) from 0 to 30 . An expression for this is

$$
\sum_{x=0}^{30}\binom{65}{x} 0.52^{x}(1-0.52)^{65-x}
$$

In R this would be

```
> pbinom \((x\), size \(=n\), prob \(=p)\)
```

[1] 0.2062585
And that's it.
